

DAY-13 DOM - Theory Questions & Answers -

① What is DOM in JavaScript? Why do we need DOM?

→ DOM (Document Object Model) is a representation of an HTML document as a objects.

→ It allows JavaScript to access and change HTML elements, content & styles dynamically.

② What is difference b/w HTML & DOM?

HTML	DOM.
* HTML is used to create the structure of a webpages * It is a markup language	* DOM represents the HTML pages as objects. * It is an object model used by JavaScript.

③ What is the document object in JavaScript?

→ The document object represents the HTML document.

→ It is used to access and manipulate HTML elements using JavaScript.

Ex) `document.getElementById("heading");`

④ What are DOM Selectors? Name the DOM selector methods.

→ DOM selectors are methods used to select HTML elements from a webpage.

Important DOM Selectors -

① `getElementById()`

② `getElementsByClassName()`

3. get Element By TagName()
4. query Selector()
5. query SelectorAll()

5. What is difference b/w getElementById() and Query Selector()?

getElementById()	Query Selector()
* Selects an element using its ID. * Does not need #.	* Selects the first element matching a CSS selector. * uses CSS selector syntax like #id, class

6. What is difference b/w

→ Query Selector() selects only the first matching elements.

→ Query SelectorAll() It selects all matching elements.

7. What is difference b/w

* textContent → Get or changes the text content

* innerText → Get or changes the visible text.

* innerHTML → Get or changes HTML content including HTML tag.

8. How can we change the CSS style of an HTML elements using Javascript?

→ we can change the CSS style using the style property.
