Name: Tabasiya
Batch: 2 to 4
PhoNo: 8939699807

PYTHON TEST

(1) Write the code for Asmstsong numbes.

```
no = int (input (" entes the numbes "))
temp = no
S = 0
Sum = 0
while(no > 0) ;
    s = no%10
    S = s**3
    Sum = Sum+S
    no = no//10
if (Sum == temp):
    psint (" asmstsong numbes")
else:
    psint (" not asmstsong numbes")
```

(2) Write the code to senove duplicates fson the list.:

```
a = [10, 20, 10, 30, 20, 40]
b = []
for i in a:
    if i not in b:
        b.append(i)
psint (b)
```

Output:-

[10, 20, 30, 40].

(3) What is generator. Write the code for it?

→ A Generator is a special type of iterator that produces the value one at a time using the yield keyword. Generators are used to lazy evaluation and memory efficient.

Code:-

```
# movie ticket price Generator :-

def movieticket():
    yield (300)
    yield (350)
    yield (400)
    yield (450)
    yield (500)

tickets = movieticket()

for i in tickects:
    print ("movie ticket price", i)
```

(4) Write 4 types of functions based on parameters and return type.

4 Types of functions:

i) No parameters, no return type

```
def addition():
    a = 100
    b = 150
    c = a+b
    print ("Result", c)
```

addition()

ii) With parameters and no return type.

```
def addition(a,b):
    c = a+b
    print("result:", c)

a = 100
b = 200
addition(a,b)
```

iii) With parameters and with return type.

```
def addition(a+b):
    c = a+b
    return c

a = 1000
b = 1500
result = addition(a,b)
print(result)
```

iv) No parameters and with return type

```
def evenodd():
    value = int(input("enter the value"))
    r = value%2
    if r==1:
        print("odd")
    else: print("even")
evenodd().
```

(5) Write the code for named argument, default argument type functions.

named argument :-

```
def display(sollno, name, mark):
    print('sollno', name, 'mark', mark)
display(101, 'tabassiya', 95)
```

default argument :-

```
def display(a=20, b=15):
    print(a, b)
display(30, 20)
```
